¹ - Low Stand, No Data

² - No Data From One or More Locations

2014 WSU Soft White Winter Wheat Trial Summary

Precipitation Zone <12” – Preliminary Data

1. Soft white winter wheat grain yield across five locations and 48 entries in the <12” precipitation zone averaged 35 bushels/acre, 15 bushels/acre lower than the 2013 average of 50 bushels/acre. The CV for the average data was 11, similar to the 2013 CV value. Crop emergence in the 2014 trials was poor at St. Andrews and reduced for some entries at Lind by crusting, over-winter some varieties were affected by winter stand losses. This precluded further data acquisition at St. Andrews. Careful interpretation of results is needed for this data set with those limitations.
2. Yields among entries across five locations ranged from 29 to 41 bushels/acre and reflected the below average growing season. ‘Curiosity CL+’, ‘Otto’, and ‘Xerpha’ were the highest yielding named varieties averaged across locations. Stripe rust was not a factor in these trials.
3. Test weight averaged 60.2 lbs./bu across locations and entries and was similar to last year’s 59.9 lbs./bu average. Grain protein averaged 11.3%, also similar to last year’s 11.2% value.
