Dusty Soft White Winter Wheat – Preliminary Data

1. Grain yield in the 2014 Dusty soft white winter wheat trial averaged 115 bushels/acre, higher than the five-year average of 107 bushels/acre. The Dusty nursery was located about four miles northwest of Dusty, WA (B. Morasch, Cooperator).
2. This nursery was seeded on 23 September, 2013 following fallow. Seed was placed at an 85#/acre seeding rate using a double-disc plot drill with 6-inch row spacing. Base fertilizer was 80#N/acre applied pre-plant. Fall seeding and emergence were adequate. The crop survived cold December temperatures under some snow cover and no stand-loss over winter was observed.
3. Yields reported ranged from 97 to 137 bushels/acre. All yield values within the 10% LSD range of the highest yield are shown in bold and this included three of the 48 entries in this trial. The variety 'Bobtail', was the highest yielding named entry in the trial. Bobtail had overwinter stand loss at other locations without snow cover. 'Cara' had the highest yield over five years at this location. There was no significant stripe rust observed at this location and no fungicide was applied.
4. Test weights averaged 59.2 lbs./bu and ranged from 56.4 to 62.1 lbs./bu. Grain protein at 11.9% averaged higher than in 2013 with a range of 10.9 to 12.9%. Plant height averaged 39 inches and a small amount of lodging occurred by a few entries.
