St. John Soft White Winter Wheat

1. Grain yield in the 2014 St. John soft white winter wheat trial averaged 98 bushels/acre, less than the five-year average of 123 bushels/acre. The St. John nursery was located about three miles east of St. John, WA (Mac Mills, Cooperator).
2. This nursery was seeded on 26 September, 2013 following fallow. Seed was placed at an 85#/acre seeding rate using a plot drill equipped with double-disc openers on 6-inch spacing. Base fertilizer was 90#N/acre pre-plant. Fall seeding and emergence were adequate. The entries survived cold December temperatures in this trial better than at many locations with only minor reduced stands evident in the spring.
3. Yields reported ranged from 81 to 114 bushels/acre. All yield values within the 10% LSD range of the highest yield are shown in bold and this included 6 of the 60 entries in this trial. The club variety 'ARS-Chrysal', was the highest yielding named entry in the trial. The club 'Cara' had the highest yield over five years at this location. No stripe rust was observed or fungicide was applied.
4. Test weights averaged 60.1 lbs/bu and ranged from 57.3 to 62.7 lbs/bu. Grain protein at 10.6% averaged lower than in 2013 with a range of 9.4 to 11.9%. Plant height averaged 34 inches with no lodging.
