Reardan Hard Winter Wheat - Preliminary Data

1. Grain yield in the 2012 Reardan hard winter wheat trial averaged 72 bushels/acre, 23 bushels/acre lower than the 5-year average. The Reardan nursery was located about 3 miles northeast of Reardan, WA (H. Johnson & T. Carsten, cooperators).
2. This nursery was seeded on 23 September, 2011 following fallow. Seed was placed at an 85#/acre seeding rate using a double-disc plot drill set on 6-inch spacing. Base fertilizer was 92#N/acre applied pre-plant. Based on a spring soil test showing 179 lbs./acre available N, 139#N/acre additional fertilizer was applied for hard wheat protein based on expected yields. Fall seeding conditions were good as were emergence and stand establishment.
3. Yields ranged from 53 bu/ac to 93 bu/ac. The hard white variety 'MDM' was the highest yielding named entry in this trial. All yield values within the 10% LSD range of the highest yield are shown in bold and this included 3 of the 24 entries. MDM was also the top yielding hard entry across five years of results at this location. Stripe rust potential at this location was low and fungicide was applied on 8 May with the herbicide application.
4. Test weights were good averaging 61.4 lbs./bu and ranged from 59.3 to 63.3 lbs./bu. Grain protein averaged 13.3% with a range of 11.7 to 15.4%. Plant height averaged 35 inches and there was no Lodging.
